

SKINCHANGE.DK

CONFIDENTIAL REPORT

SEO & GEO Audit Report

A full technical and content analysis of skinchange.dk across SEO (Search Engine Optimization) and GEO (Generative Engine Optimization / AI visibility) dimensions — with scored findings and prioritized action items.

March 2026 · Prepared by SKIND Agent

CURRENT SCORES

✔ WHAT'S ALREADY WORKING WELL

- | | |
|--|---|
| ✔ Proper <title> + meta description on all pages | ✔ Canonical URLs set on most pages |
| ✔ Open Graph + Twitter Card tags present | ✔ Bilingual (da/en) with hreflang in sitemap.xml |
| ✔ Rich JSON-LD: MedicalOrganization, Physician, FAQPage, Article, Service, Offer, BreadcrumbList | ✔ Static site generation (SSG) — excellent crawlability |
| ✔ 8 condition-specific blog articles (acne, rosacea, HSV, etc.) | ✔ robots directives set: index, follow |
| ✔ Alt text on images throughout the site | ✔ Semantic heading hierarchy (h1 → h2 → h3) |
| ✔ GDPR / MitID trust signals (strong for medical E-E-A-T) | ✔ Physician schema with Peter Bjerring credentials |

CRITICAL ISSUES

CRITICAL

#1

OG image /og-image.jpg returns 404 — social sharing is broken

SEO +8

GEO +5

The OG image referenced in all pages (<https://www.skinchange.dk/og-image.jpg>) does not exist — returns 404. Every share on Facebook, LinkedIn, Twitter/X, WhatsApp, and iMessage shows a broken/blank preview. This kills click-through rates from social and reduces AI crawler confidence in content quality. Fix: create a 1200×630px branded image and upload it to /public/og-image.jpg.

CRITICAL

#2

Blog articles + FAQ sub-pages missing from sitemap (30+ missing URLs)

SEO +7

GEO +4

The sitemap.xml contains only 16 URLs. Missing: 8 blog articles × 2 languages (/da/blog/acne, /en/blog/rosacea, etc.), /da/blog + /en/blog index, and all 6 FAQ category pages (/da/faq/how-it-works, /da/faq/diseases, etc.) — totalling 30+ uncovered URLs. Google cannot guarantee discovery and indexing of this content without sitemap entries. Fix: extend sitemap.ts to include all blog slugs and FAQ category slugs.

CRITICAL

#3

Google Search Console not verified — placeholder code in production

SEO +5

The meta tag google-site-verification is literally set to "your-google-verification-code" — a placeholder that was never replaced. Without GSC verified, there is zero insight into crawl errors, indexing status, keyword performance, Core Web Vitals from field data, or manual penalties. This is foundational. Fix: create a GSC property, get the real verification code, and update layout.tsx.

CRITICAL

#4

Duplicate + conflicting structured data — fake review count (15,000 vs 100+ actual)

SEO +5

GEO +5

layout.tsx injects a MedicalOrganization schema AND page.tsx injects a separate MedicalBusiness schema for the same entity — two conflicting @types. Additionally, the MedicalBusiness schema claims aggregateRating.reviewCount: 15000 while the live stats section shows "100+ cases." Google's Rich Result guidelines explicitly flag fabricated review counts as a manual penalty risk. Fix: consolidate to one schema block, remove or correct the fake review count.

CRITICAL

#5

hreflang not in <head> — only in sitemap (weakest signal)

SEO +4

The rendered HTML <head> contains no <link rel="alternate" hreflang="..."> tags. While the sitemap.xml includes xhtml:link alternates, Google recommends implementing hreflang in all three places (HTML head, HTTP headers, sitemap). Relying solely on sitemap is the weakest method and misses the in-page signal entirely. Fix: ensure the Next.js metadata alternates.languages configuration correctly renders to <link> tags in the HTML head.

SIGNIFICANT ISSUES

SIGNIFICANT

#6

No robots.txt accessible — 301 redirect loop on skinchange.dk/robots.txt

SEO +4

GEO +2

Accessing skinchange.dk/robots.txt returns a 301 redirect with no proper robots.txt served. Without it, crawlers have no guidance on which paths to crawl or avoid, and there's no Sitemap declaration pointing crawlers to sitemap.xml. Fix: add a public/robots.txt file with proper Sitemap reference and any necessary Disallow rules.

SIGNIFICANT

#7

Blog article authors attributed to Organization instead of Person (E-E-A-T)

SEO +3

GEO +5

All blog article schemas use `author.@type: "Organization"` (SkinChange.AI). Google's E-E-A-T guidelines for medical content strongly favour named medical professionals as article authors. Peter Bjerring's credentials (300+ publications, adjunct professor, specialist) are already in the Physician schema — they should be cross-referenced as the article author. Fix: update Article schemas to `author.@type: "Person"` with `@id` referencing the Physician entity.

SIGNIFICANT

#8

Missing canonical URL on About page and Blog index page

SEO +4

The About page (`about/page.tsx`) and Blog index (`blog/page.tsx`) have no `alternates.canonical` in their metadata — inconsistent with the rest of the site. Without canonical tags, Google may index multiple versions or fail to consolidate link equity. Fix: add canonical + alternates to both pages' `generateMetadata` functions.

SIGNIFICANT

#9

Stats section shows English labels on Danish page

SEO +2

On the `/da/` homepage, the Stats section renders: "Cases handled", "Hour diagnosis", "Certified doctors", "Reviews" — all in English. This is a localisation failure that hurts Danish language relevance signals and user trust. Fix: connect Stats component labels to the `i18n` translation system (stats keys already exist in `i18n.ts` but aren't being used).

SIGNIFICANT

#10

Invalid telephone placeholder in MedicalBusiness structured data

SEO +2

GEO +1

`"telephone": "+45-XXX-XXXX"` is a hardcoded placeholder in the schema. Invalid/fictional contact data in structured data can cause Google to distrust the entire schema block and withhold rich results. Fix: either remove the telephone field or replace it with the real contact number.

SIGNIFICANT

#11

Blog article images hosted on Unsplash (external dependency)

SEO +2

Article hero images are loaded from `images.unsplash.com` — a third-party CDN. This creates: a dependency on Unsplash uptime, potential future 404s, inability to set descriptive filenames (`skin-condition-acne-treatment.jpg`), and loss of image SEO value. Fix: download and self-host article images in `/public/blog/` with SEO-optimised filenames and proper alt text.

GEO-SPECIFIC ISSUES (AI & LLM VISIBILITY)

GEO #12 **No MedicalCondition schema on disease blog/FAQ pages**

GEO +5

Blog articles about acne, rosacea, psoriasis etc. use generic `Article` schema but don't implement `schema.org/MedicalCondition`. LLMs and AI search engines (Google SGE, Perplexity, Bing Copilot) use `MedicalCondition` entities to build structured knowledge graphs about diseases. Adding these entities directly links SKIND's content to high-authority disease concepts. Fix: add `MedicalCondition` JSON-LD to each condition blog/FAQ page.

GEO #13 **No speakable schema on FAQ pages**

GEO +4

AI assistants (Google SGE, Siri, Alexa, Gemini) use `schema.org/Speakable` to identify the most directly answerable content snippets on a page. Medical FAQ pages are prime candidates — short, authoritative Q&A pairs about conditions, pricing, and how the service works. Without `speakable` markup, AI systems have no explicit guidance on which content to surface as answers. Fix: add `Speakable` schema to FAQ category pages pointing to the accordion question/answer blocks.

GEO #14 **Patient testimonials have no Review / AggregateRating schema**

SEO +1

GEO +3

The homepage `FeedbackSection` has real patient quotes (e.g., Jofrajen's mole story) but zero structured data. `Review` schema with real ratings enables Google star rich results, increases AI confidence in the service's trustworthiness, and directly supports E-E-A-T. Fix: add `Review` + `AggregateRating` schema to the feedback section using actual verified review data.

GEO #15 **Missing x-default hreflang**

SEO +1

GEO +1

Neither the sitemap nor the HTML head includes an `x-default hreflang` entry (`hreflang="x-default"`). This tag tells search engines which version to serve to users whose language isn't matched — critical for a service targeting both Danish and international English speakers. Fix: add `x-default` pointing to `/da` (or a redirect landing page) in both `sitemap.ts` and the layout metadata.

PRIORITY ACTION PLAN

PRIORITY	#	FIX	SEO	GEO	EFFORT
1	#1	Create & upload OG image (1200×630px)	+8	+5	Low
2	#2	Add blog & FAQ sub-pages to sitemap.ts	+7	+4	Low
3	#3	Replace GSC placeholder with real verification code	+5	—	Low
4	#4	Fix duplicate schema & remove fake 15,000 review count	+5	+5	Medium
5	#5	Fix hreflang rendering in HTML <head>	+4	—	Low
6	#6	Add robots.txt with Sitemap declaration	+4	+2	Low
7	#8	Add canonical + alternates to About & Blog pages	+4	—	Low
8	#7	Article author → Peter Bjerring Person schema	+3	+5	Low
9	#12	Add MedicalCondition schema to disease pages	—	+5	Medium
10	#9	Fix Stats English labels on Danish homepage	+2	—	Low
11	#13	Add Speakable schema to FAQ pages	—	+4	Medium
12	#14	Add Review schema from patient testimonials	+1	+3	Medium
13	#10	Remove/replace +45-XXX-XXXX telephone placeholder	+2	+1	Low
14	#11	Self-host blog article images	+2	—	Medium
15	#15	Add x-default hreflang	+1	+1	Low

PROJECTED SCORES AFTER ALL FIXES
